Microglia TE-age occupancy, ATAC signal, RNA expression and gene density

Outer → inner: low-divergence TE peak enrichment (<10%); high-divergence TE peak enrichment (≥20%); ATAC bigWig mean; RNA gene mean $\log_2$(CPM+1); gene density. Gold ticks: target-peak TE copies without WT 3 mo peak overlap.

5 Mb mm10 windows. TE age is a RepeatMasker divergence proxy. Enrichment compares each window with its group-wide age-class occupancy rate; peak calls are descriptive and quality-dependent.
