GSE212606 · TE architecture across annotated ATAC cell types

A TE copy number and accessible peak coverage

28 calibrated cell types; equal-cell-type mean peak-bp fraction

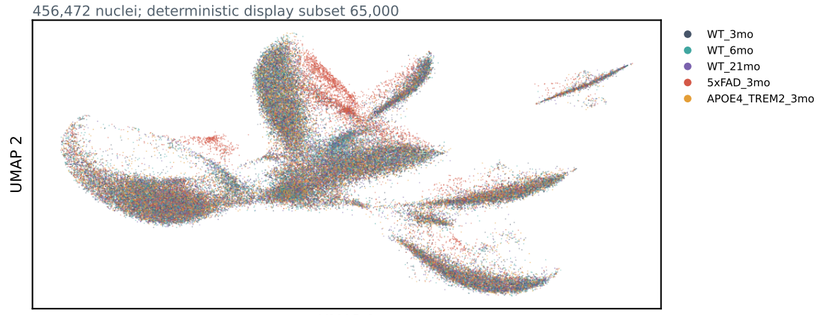

B Genomic position of TE copies and initial peaks

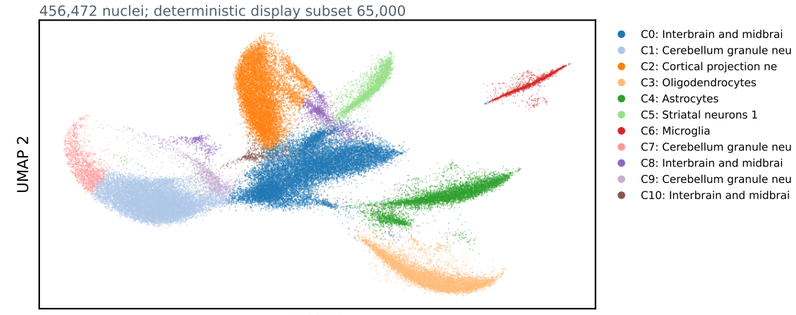

C All ATAC nuclei · condition

456,472 nuclei; deterministic display subset 65,000

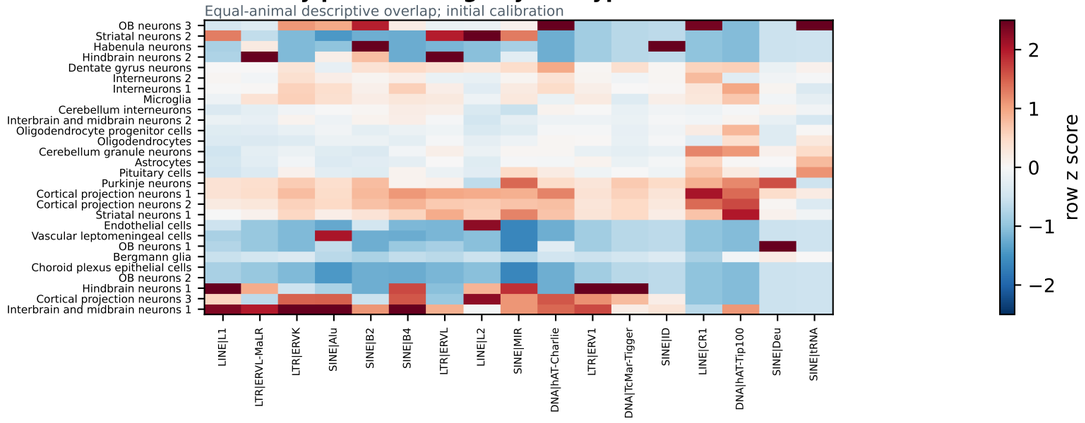

D All ATAC nuclei · initial clusters

456,472 nuclei; deterministic display subset 65,000

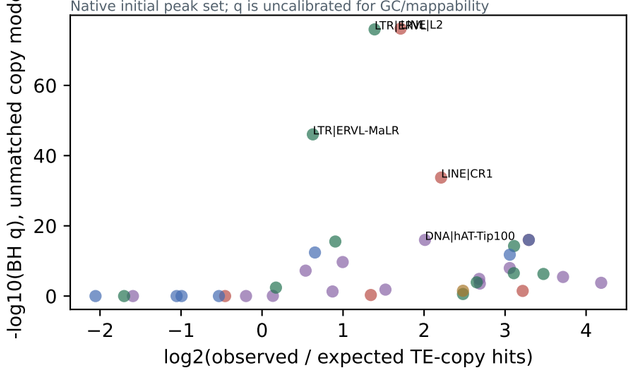

E TE-family peak coverage by cell type

Equal-animal descriptive overlap; initial calibration

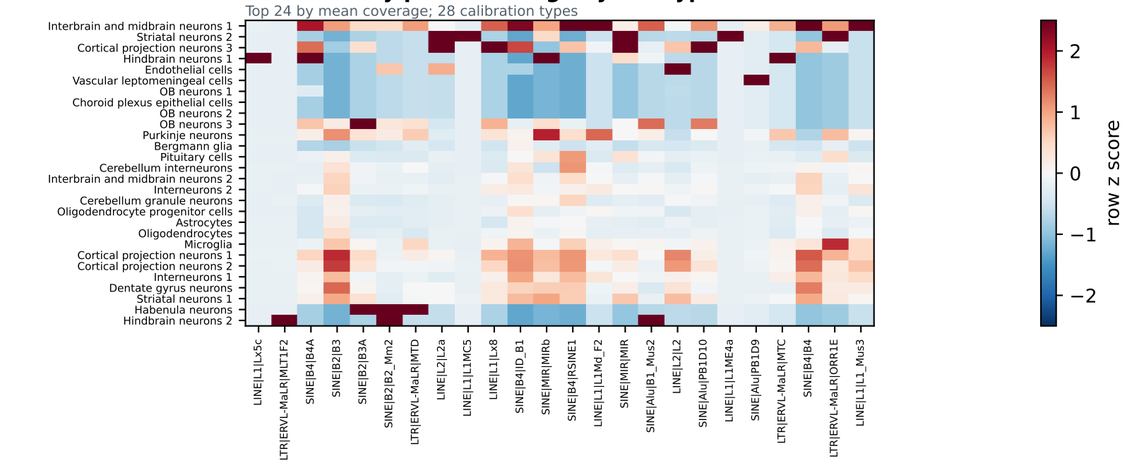

F Exploratory global TE-family copy enrichment

Native initial peak set; q is uncalibrated for GC/mappability

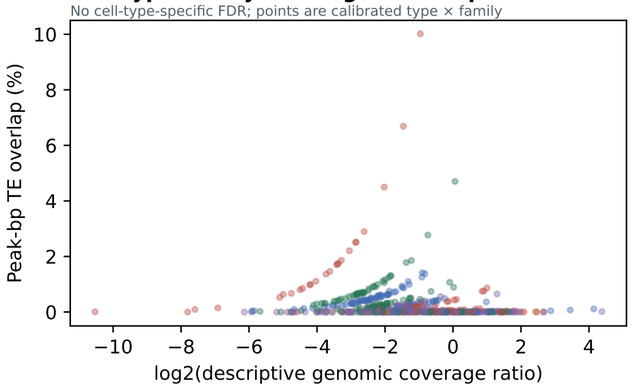

G TE-subfamily peak coverage by cell type

Top 24 by mean coverage; 28 calibration types

H Cell-type–family coverage landscape

No cell-type-specific FDR; points are calibrated type × family

I Animal-level TE overlap by annotated ATAC cell type

Initial calibration peaks, up to 20 animals per type; descriptive
